PART - B

Q.No	Questions	Marks	COs	BT
1. a)	Derive the E.M.F equation of a transformer.	04	02	02
b)	A 600 kVA transformer has an efficiency of 92% at full-load, unity power factor and at half-load, 0.9 power factor. Determine its efficiency at 75% of full-load and 0.9 power factor	06	03	03
2. a)	Explain the constructional details of core and shell type transformer.	05	02	01
b)	A single phase, 20 kVA transformer has 1000 primary turns and 2500 secondary turns. The net cross-sectional area of the core is 100 cm^2. When the primary winding is connected to 500V, 50 Hz supply. Calculate i) The maximum value of the flux density in the core ii) The voltage induced in the secondary winding iii) The primary and secondary full load currents	05	02	02
3. a)	A coil of power factor 0.6 is in series with 100μF. When connected to a 50Hz supply, the potential difference (p.d) across the coil is equal to the p.d cross the capacitor. Find the resistance and inductance of the coil.	05	02	02
b)	Show that a pure inductance does not consume any power. Draw the waveforms of voltage, current and power, when a sinusoidal voltage is applied to a pure inductance.	05	02	02
4. a)	Define the following terms: i)Instantaneous value ii) Amplitude iii) form factor and iv) Peak factor	04	01	01
b)	A current $i = 10 \sin(314t - 10°)$ A produces a potential drop $v=220 \sin(314t+20°)$V in a circuit. Find the values of the passive elements, assuming a series combination of only two passive elements is supplied from a source.	06	02	02
5. a)	Derive an equation for the power consumed by an R-C series circuit. Draw the waveforms of voltage, current, and power.	05	02	01
b)	An inductive coil takes a current of 33.24 A from 230V,50Hz supply. If the resistance of the coil is 6Ω. Calculate the inductance of the coil and the power taken by the coil.	05	02	02

Course Code	**EE123ATD**	**Duration**	**110 Mins**
Sem	**II Semester**	**Improvement Test**	
Basics of Electrical Engineering			

PART - A				
Q.No	**Questions**	**Marks**	**COs**	**BT**
1.	Define voltage regulation of a transformer.	2	CO2	L1
2.	A 11000 / 220V , 50Hz, 1-phase transformer takes a current of 20A,if the number of turns on the primary side is 1000. The primary and secondary currents are I_1 =--------- and I_2=--------- .	2	CO2	L2
3.	Mention the constant and variable losses in transformers, and also write the equation for the same.	2	CO1	L1
4.	The current in a circuit is (8 – j10)A, when the applied voltage is (50 +j25)V . determine the impedance and power factor of the circuit.	2	CO1	L2
5.	The equation for an alternating current is given by i = 28.28 sin(314t +30°) A. Find its r.m.s , frequency and phase angle	2	CO2	L1

			Marks
	Determine the resistance and inductance of the load per phase, the total reactive power and total apparent power.		04
5. a)	Prove that, the readings of the wattmeter's are in terms of $\cos(30+\phi)$ and $\cos(30-\phi)$ while measuring the power of a three-phase circuit. Mention the status of two wattmeter's at power factors: 1, 0.5 and 0 respectively.	6	2	3
b)	Input power to a three-phase circuit was measured by two wattmeter method. The readings were 3kW and 1.5kW. Determine the total power consumed and the power factor of the balanced three phase circuit.	4	3	2

Basics of Electrical Engineering

Date	19th June 2024	Maximum Marks	50
Course Code	22ES24D	Duration	90 Mins
Sem	II Semester	CIE -2	

Basics of Electrical Engineering

Q.No	CIE - 2	Marks	COs	BT
1. a)	Derive expressions for Effective and Average value of an alternating quantity.	4	2	2
b)	An alternating current varying sinusoidally with a frequency of 50 Hz has an RMS value of 20 A. Write down the equation for the instantaneous value and find this value (a) 0.0025 second (b) 0.0125 second after passing through a positive maximum value. At what time, measured from a positive maximum value, will the instantaneous current be 14.14 A?	6	2	3
2. a)	Prove that in a series RL Circuit, Power consumed is $P = VI\cos\phi$ with all relevant equations, phasor diagram and Graphical representation.	5	2	3
b)	A current of 5 A flows through a non-inductive resistance in series with a choking coil when supplied at 250-V, 50-Hz. If the voltage across the resistance is 125 V and across the coil 200 V, calculate (a) impedance, reactance and resistance of the coil (b) the power absorbed by the coil and (c) the total power. Draw the vector diagram.	5	3	3
3. a)	A three-phase delta connected motor operating on a 400 V supply is delivering 25 HP at an efficiency of 0.87 and power factor of 0.42. Calculate the line current, phase current and the readings of two-watt meters connected to measure the input. Assume, 1hp=746 w.	6	3	3
b)	Explain the advantages of 3 phase circuits over single phase circuits.	4	1	2
4. a)	Arrive at the Voltage and Current expressions for 2 types of connections of a 3-phase circuit.	5	1	2
b)	A balanced, three phase, star connected load is fed from a 400V, three phase, 50Hz supply. The current per phase is 25 A(lagging) and the total active power absorbed by the load is 13.856 kW.	5	3	3

b) Calculate the electric bill at the end of a month of 30 days at Rs.2.00 per unit if 6 lamps of 40 watt each burn for 8 hours per day, an electric iron of 1 kW is used for 2 hours per day and 4 fans of 50 watt each are used for 10 hours per day. — 6 — 4

Name of the Appliance	Power Rating (W)	Avg. Daily Usage Hrs	No. of Appliances	Daily Energy Required (Wh)
lamps	40	8	6	1920
electric	1kw	2	1	2000
fan	50	10	4	2000
Total Energy				5920Wh

Total energy consumed per day Etotal=E1+E2+E3
=1920+2000+2000=5920 Wh
5.920 kWh or units
Total energy consumed per month =30×Etotal
=30×5.92 = =177.60 kWh or 177.60 units

Bill for one month =Rate/unit×units=(Rs.2.00/unit)×(177.60 units)
=Rs.355.20
So the electric bill at the end of a month will be **Rs.355.20**

<table>
<tr><td></td><td>5. Electrical hazards include exposed energized parts and unguarded electrical equipment which may become energized unexpectedly. Such equipment always carries warning signs like “Shock Risk”.
6. Always use appropriate insulated rubber gloves and goggles while working on any branch circuit or any other electrical circuit.
7. Never try repairing energized equipment. Always check that it is de-energized first by using a tester.
8. Never use an aluminum or steel ladder if you are working on any receptacle at height in your home. An electrical surge will ground you and the whole electric current will pass through your body. Use a bamboo, wooden or a fiberglass ladder instead.</td><td></td><td></td></tr>
<tr><td>b)</td><td>What is the necessity of earthing the electrical appliances? Explain with diagram pl earthing.
Necessity of Earthing:
1. To protect the operating personnel from danger of shock in case they come in contact with the charged frame due to defective insulation.
2. To maintain the line voltage constant under unbalanced load condition.
3. Protection of the equipments
4. Protection of large buildings and all machines fed from overhead lines against lightning.

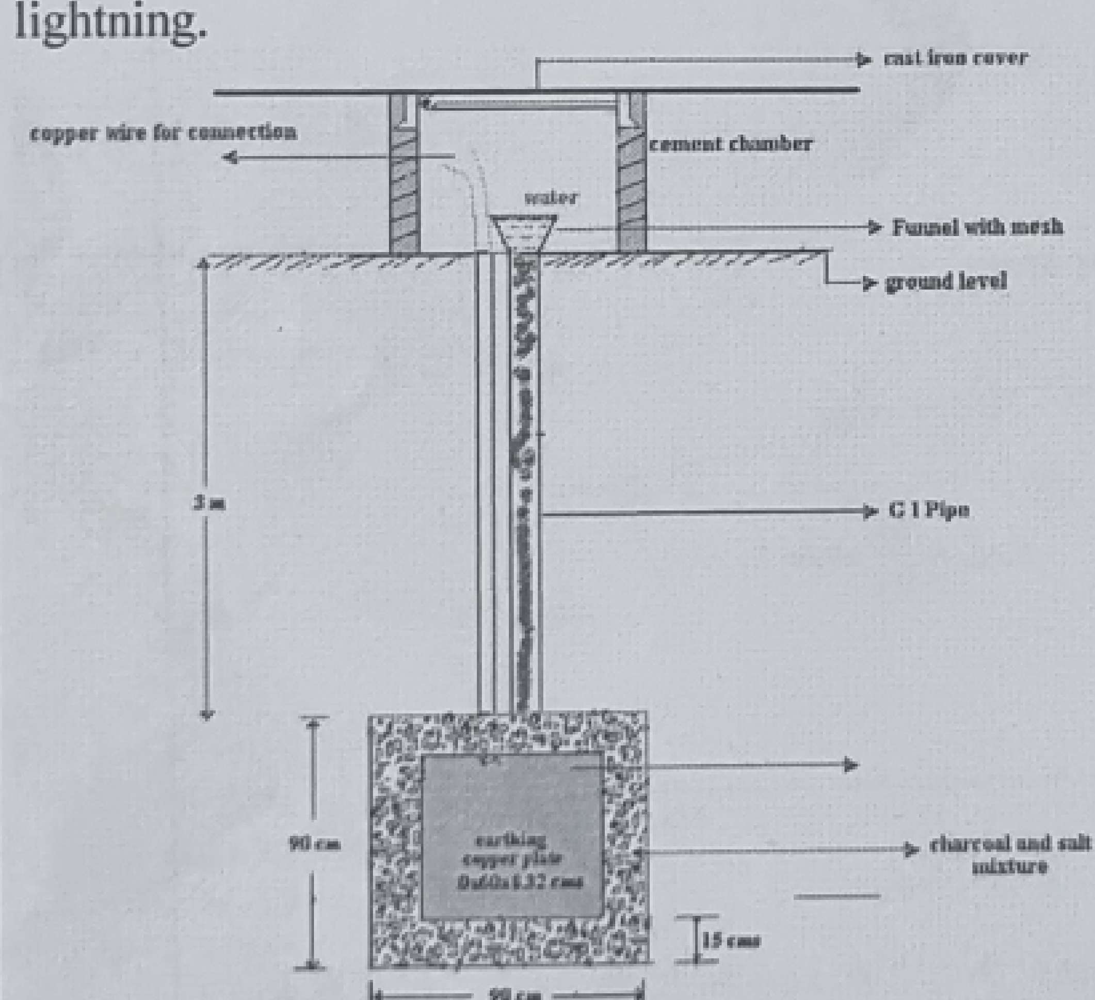

PLATE EARTHING</td><td>6</td><td>3</td></tr>
<tr><td>5a)</td><td>Explain the concept of power transmission and distribution through block diagrams.</td><td>4</td><td>2</td></tr>

3a)	Using Thevenin's Theorem find V_{TH}, R_{TH} and the load current I_L flowing through and load voltage across the load resistor in the circuit below. 	5	3
	 Remove the 5 kΩ from the circuit.Measure the open-circuit voltage. This will give you the Thevenin's voltage (V_{TH}). 0.75 MA **I = 48 V /(12 kΩ + 4 kΩ) = 3 mA** 12 Thevenin's Resistance Rth calculated as follows: 8kΩ + (4k Ω || 12kΩ) R_{TH} = 8 kΩ + [(4 kΩ x 12 kΩ) / (4 kΩ + 12 kΩ)] R_{TH} = 8 kΩ + 3 kΩ R_{TH} = 11 kΩ		
b)	State and prove Maximum power transfer theorem.  The maximum power transfer theorem states that the power delivered to the load resistor is maximized when the load resistance is equal to the series resistance. This can be calculated by taking the derivative of the power equation with respect to the load resistance and calculating the critical point.	5	2
4a)	Mention any eight precautions against Electric Shock. 1. The first step of electrical safety, avoid water at all times when working with electricity. Never touch or try repairing any electrical equipment or circuits with wet hands. It increases the conductivity of the electric current. 2. Never use equipment with frayed cords, damaged insulation, or broken plugs. 3. If you are working on any receptacle at your home then always turn off the mains. It is also a good idea to put up a sign on the service panel so that nobody turns the main switch ON by accident. 4. Always use insulated tools while working.	4	3

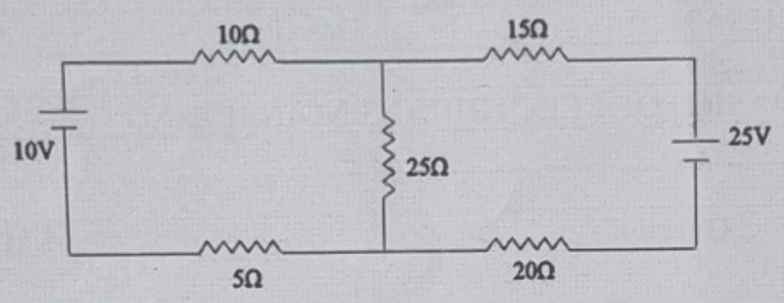
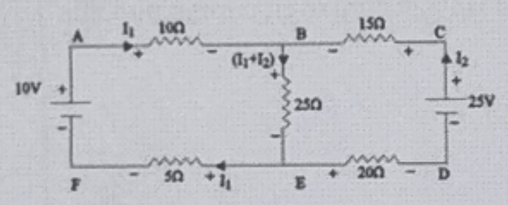
2a)	Calculate the branch current in 15 Ω resistor by applying Kirchhoff's law	5	2





Consider the loop ABEFA & apply KVL in CLK wise

$10 - 10I_1 - 25(I_1 + I_2) - 5I_1 = 0$

$10 - 10I_1 - 25I_1 - 25I_2 - 5I_1 = 0$

$-40I_1 - 25I_2 + 10 = 0$

$40I_1 + 25I_2 = 10$ (1)

Consider the loop BCDEB and Apply KVL in CLK wise direction

$15I_1 - 25 + 20I_2 + 25(I_1 + I_2) = 0$

$15I_2 - 25 + 20I_2 + 25(I_1 + I_2) = 0$

$15I_2 - 25 + 20I_2 + 25I_1 + 25I_2 = 0$

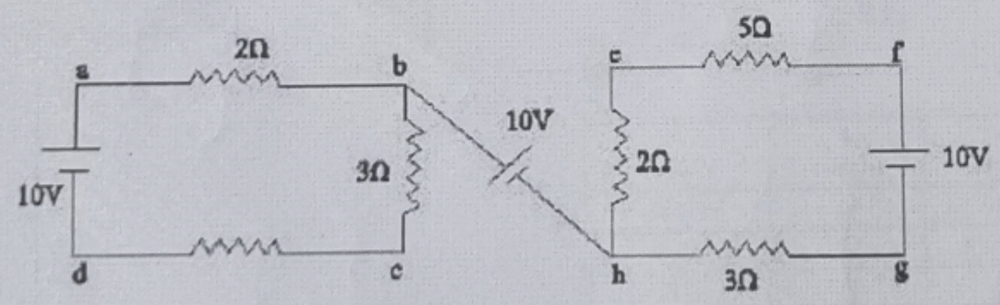
$25I_1 + 60I_2 - 25 = 0$

$25I_1 + 60I_2 = 25$ .....(2)

$I_2 = 0.42$ Amps.

Current in 15 Ω resistor is 0.42Amps.

b)	For the Circuit shown below determine voltages Vdf .	5	2



Apply KVL to loop abcda

$10 - 2I_1 - 3I_1 - 5I_1 = 0$

$-10I_1 = -10$

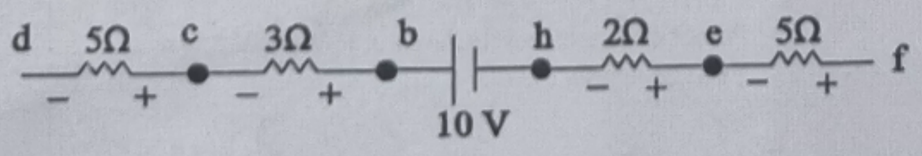
$I_1 = 1$ Amps

Apply KVL to loop efghe

$5I_2 - 10 + 3I_2 + 2I_2 = 0$

$10I_2 = 10$

$I_2 = 1$ Amps



$V_{df} = -5(I_1 - 3I_1 + 10 + 2I_2 + 5I_2)$

$V_{df} = -5 - 3 + 10 + 2 + 5$

$V_{df} = 9$ Volts.

$V_{df} = -9$ Volts [$\because$ because - sign on d side + on f side]

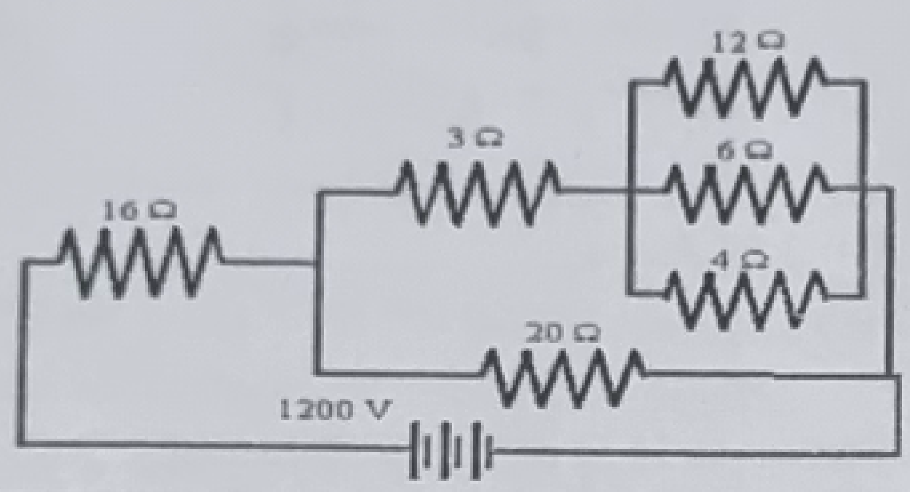
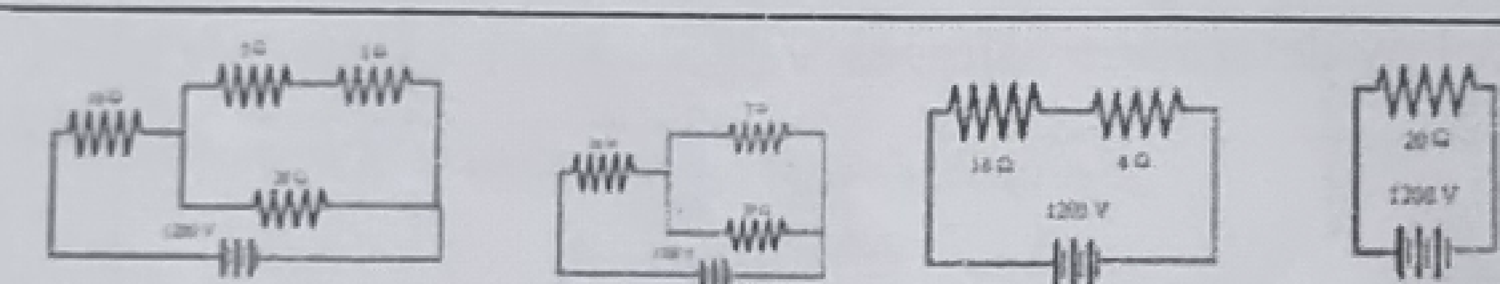
Sem	2^{nd} sem	Test-1	
COURSE NAME: BASICS OF ELECTRICAL ENGINEERING			

Sl. No	Questions	Marks	CO
1a)	Find the equivalent resistance of the circuit shown . Find the voltage drop over, current through, and power dissipated by each resistor.	5	2



sol



Resistor (Ω)	V (Volts)	I (Amps)	P (Watts)
16	960	60	57600
20	240	12	2880
3	144	48	6912
12	96	8	768
6	96	16	1536
4	96	24	2304
20	1200	60	72000

Sl. No	Questions	Marks	CO
b)	A 100W, 200V bulb is put in series with a 60W bulb across a supply. What will be the current drawn? What will be the voltage across the 60W bulb? What will be the supply voltage?	5	2

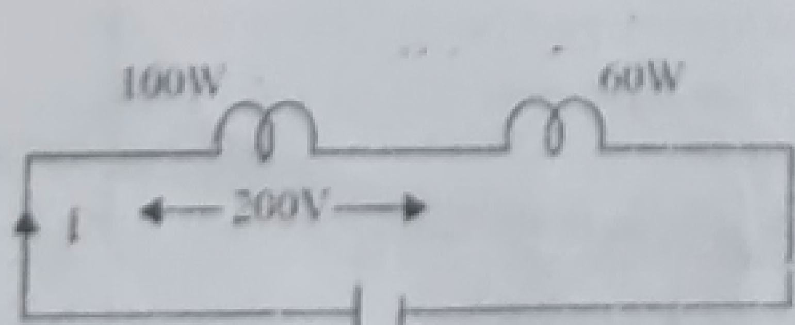
Power dissipated in the first bulb, $P_1 = V_1 I$

Current, $I = P_1 / V_1 = 100/200 = 0.5\,A$

Power dissipated in the second bulb, $P_2 = V_2 I$

Voltage across the 60 W bulb,

$$V_2 = \frac{P_2}{I} = \frac{60}{0.5} = 120V$$



The supply voltage, $V = V_1 + V_2 = 200 + 120$

$V = 320V$

The supply voltage, V = 320 V.
