Laboratory Experiments Implement the following programs using cc/gcc compiler	
1	<p>Implement the following requirement: An electricity board charges the following rates to domestic users to discourage large consumptions of energy.</p> <p>0 - 100 units : Rs 1.50 per unit 101 - 200 units : Rs 1.80 per unit Beyond 200 units: Rs 2.50 per unit</p> <p>All users are charged a minimum of Rs 50. If the total amount is more than Rs 300 then an additional surcharge of 15% is added. The C++ program must read the names of users, number of units consumed and display the calculated charges.</p>

Implement member functions</p> <ul style="list-style-type: none"> a. to read student data like name and test marks, b. to compute average marks (considering best two out of three test marks) and c. to display the student information. <p>Declare an array of STUDENT objects in the main function, use static data member to generate unique student roll number.</p>

4	<p>Design and implement a C++ class POLYNOMIAL. The internal representation of a POLYNOMIAL is an array of terms. Each term contains a coefficient and an exponent, e.g., the term $2x^4$ has the coefficient 2 and the exponent 4. Implement a class containing constructors and the following capabilities:</p> <ul style="list-style-type: none"> a. Overload the addition operator (+) to add two polynomials. b. Overload the assignment operator to assign one polynomial to another. c. Overload the multiplication operator (*) to multiply two polynomials. d. Overload the >> operator to enable input through in. e. Overload the << operator to enable output throughout. f. Member function to compute value of the polynomial, given the value of x.
5	<p>Design and implement a C++ program to create an abstract class - SHAPE to represent any shape in general. The class should have two pure virtual functions to read dimensions and to compute the area. Create three derived classes - CIRCLE, RECTANGLE, and SQUARE by inheriting the features of class SHAPE. Implement the functions to read and compute the area. Add constructors, method to display the results as required. (Assume appropriate attributes).</p>
6	<p>Write a C++ program using generic class to implement queue of integers, floating point numbers and strings. Support the queue operations like insert, delete and display in the queue class.</p>
7	<p>Write a C++ program to create a vector of integers. Copy the vector contents into a list, sort the contents, then copy selected items into another vector (like elements less than 10 etc).</p>
8	<p>Write a template function to search for a given key element from an array. Illustrate how you perform search in integer, character as well as double arrays using the same template function.</p>
